

Irish Moiled A.I Bulls 2026 Catalogue

FOREWORD

The Irish Moiled Cattle Society pride the selection of A.I bulls they offer to breeders. All bulls underwent a visual inspection by the Society before the decision was took to collect their semen for A.I. All bulls met a minimum standard of conformation, are free from defects and all the bulls have very good breed character, a trait the Society feel is very important. The bulls in the main section of the catalogue are eligible for use by all breeders of cattle throughout all UK and Republic of Ireland. At certain times, certain bulls, in certain areas will run in low supply, this information will be published in the catalogue.

The Society encourages and advises breeders when selecting an A.I bull to select a bull that when mated with the intended female, the offspring is of a low inbreeding coefficient. The inbreeding coefficient of offspring should be less than 7.5%, however, breeders should aim that calves born have inbreeding coefficients of less than 5%. Inbreeding coefficients of more than 10% should be avoided. The Society will endeavour to keep a selection of bulls on A.I, so that each of the A.I bulls can be used on the daughters of any of the other bulls. Any breeder can request from the Society an inbreeding coefficient report of all the A.I bulls against all the females in their herd.

The Society encourages breeders to select bulls using the classification tool if possible. If a bull has been highly classified, it adds guarantee that the bull has a good conformation and is structurally sound. For young bulls that are not yet classified, breeders should check out the young bull's back pedigree. Young bulls that are out of high classified parents and grand-parents are most likely to be high classified themselves when their time comes. For older bulls that were not classified before they died, it is useful to check out how their progeny are scoring when classified.

Breeders will be inclined to use the ICBF Eurostar Rating System to help with their bull selection. It must be highlighted that as the reliability of the data increases for an individual animal the score and values may change. For bulls with a low genomic reliability value of 35% or lower, the actual genomic values and scores are more likely to change in the future, whilst bulls with a high genomic reliability of 60% or over, the genomic values and scores are less likely to change in the future.

Genomics is a new tool to the Irish Moiled breed, as more research and data is gathered the accuracy of genomics will improve. The accuracy of some traits will improve at a faster rate than other traits. The polled gene test at ICBF is not validated for the Irish Moiled breed and breeders should not rely on the test for breeding decisions. Further research in the future will be done to validate this test for the Irish Moiled breed.

If possible, breeders should use a combination of coefficients, classification and genomics to choose their bull.

All bulls in the main section of the catalogue owned by the IMCS have undergone a semen quality motility test. Semen with a motility score of 40% or over is considered excellent quality. Semen with a motility score of around 35% is considered very good quality. Semen with a motility score of 30% is considered average quality and semen with a motility score of 20% or under is poor quality.

Bulls ranked by the Genomic Eurostar Indexes

| | BULLS RANKED BY MATERNAL INDEX | | | |
|-----|--------------------------------|----------|---------|-------------|
| | NAME | MATERNAL | VALUE | RELIABILITY |
| 1ST | RAVELGLEN EARL | 5 STAR | 76 Euro | AVERAGE |
